

ThermoWood® NEW in USA

Weather and Insect Resistant

All Natural Solid Wood

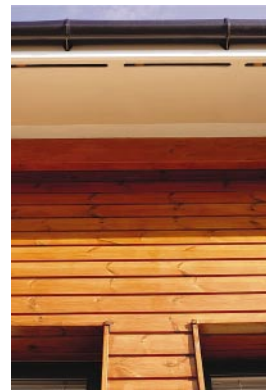

ThermoWood® is produced with a patented three-stage treatment process that controls heat, time and moisture to close wood fibers and remove natural sugars. No chemicals are used, so it is very eco-friendly.

This all-natural, solid wood product offers greater dimensional stability, along with improved decay and insect resistance. The wood is lighter in weight, resin-free and has an attractive, consistent color.

When left untreated and exposed to UV light, ThermoWood® weathers from its dark brown color to a soft grey. It accepts surface treatments well—both because of its stability and because there is no resin leakage.

Ideal for siding and decking, the product is suitable for interior or exterior use. ThermoWood® is available in standard profiles and several lengths. It is readily shipped to any point in North America.

Made with PEFC-certified Nordic Pine and Spruce from sustainable, managed forests in Finland, it is a naturally carbon-neutral product. The production process uses about the same energy as kiln drying.
